

ClinicalFlow Systems

Modernizing clinical workflows through intelligent software solutions.

Intern Full Stack Engineer

 Austin, TX

 Internship

 \$22–\$38 per hour

About ClinicalFlow Systems

Founded in 2019, ClinicalFlow Systems is a healthtech startup dedicated to streamlining operational workflows in hospitals and outpatient clinics. Our platform helps clinical teams reduce administrative burden and focus more time on patient care through real-time task orchestration and data integration. We serve over 150 healthcare facilities across the US, ranging from rural clinics to large academic medical centers. Our growing team of 45 engineers, designers, and clinical advisors is headquartered in Austin with a strong culture of mentorship and continuous learning.

Role Summary

Join ClinicalFlow Systems as an Intern Full Stack Engineer and gain hands-on experience building features that directly impact healthcare operations. You'll work alongside our core product team on our full-stack web platform, tackling small features, bug fixes, and quality improvements across our React frontend and Node.js backend. This is an ideal opportunity for computer science students (undergrad or recent graduates) to learn production development practices, receive dedicated mentorship from senior engineers, and contribute meaningful code to a platform used by thousands of clinicians daily. We prioritize learning and collaboration—expect pair programming sessions, code reviews, and regular feedback to help you grow as an engineer.

Responsibilities

- Implement small features and bug fixes across our React-based frontend, working with TypeScript and modern component patterns, under guidance from senior developers.
- Write and maintain unit and integration tests for backend APIs built in Node.js, learning best practices in test-driven development and quality assurance.
- Collaborate with the team on data persistence tasks using PostgreSQL, including schema design, query optimization, and data migration scripts.
- Participate in daily standups and code reviews to share progress, ask questions, and learn from peer feedback in a supportive environment.
- Document your code, design decisions, and learnings in our internal wiki and pull request comments to help the team and your own professional growth.

- Attend optional learning sessions on Docker containerization, AWS deployment pipelines, and clinical domain concepts relevant to our product.
- Support QA and product teams by reproducing bugs, writing test cases, and validating fixes in our staging environment before production deployments.

Required Qualifications

- Currently pursuing a degree in Computer Science, Software Engineering, or related field (or recently graduated); demonstrated coding ability through coursework or personal projects.
- Familiarity with JavaScript or TypeScript and willingness to learn modern React patterns and component architecture.
- Basic understanding of backend development concepts (APIs, databases, HTTP); prior experience with Node.js or Python is a plus but not required.
- Strong communication skills and genuine interest in learning from experienced engineers through mentorship and pair programming.
- Ability to work 40 hours per week for the duration of the internship (typically 10–12 weeks) and commitment to attending team ceremonies and collaborative sessions.

Preferred Qualifications

- Prior internship experience or substantial personal projects demonstrating full-stack development (frontend + backend + database).
- Exposure to React, Next.js, or Vue.js for frontend development; Node.js or Python for backend work.
- Familiarity with Git version control, SQL, and basic deployment or DevOps concepts (Docker, CI/CD pipelines).
- Personal or academic interest in healthcare, clinical workflows, or healthtech—enthusiasm to learn our domain will be cultivated on the job.

Tech Stack

TypeScript React Node.js PostgreSQL Docker AWS Git Jest

Benefits

- Competitive hourly wage (\$22–\$38 based on experience and background).
- Housing stipend or relocation assistance for interns relocating to Austin.
- Dedicated mentorship from a senior engineer who will guide your learning and career development.
- Lunch & learning sessions covering clinical domain knowledge, engineering best practices, and career development.
- Intern cohort events and team outings to build community and network with peers.

- Access to our internal learning library, coding resources, and professional development budget (\$500 toward courses or conferences).
- Strong return-offer pipeline for top performers; many interns transition to full-time roles.

How to Apply

To apply, please submit your resume, a brief cover letter (1 paragraph explaining your interest in healthtech and our role), and a link to your GitHub profile or portfolio showcasing personal projects or coursework. Send your application to internships@clinicalflow.io with the subject line 'Intern Full Stack Engineer – [Your Name].' Our recruiting team will review applications on a rolling basis. Qualified candidates will be invited to a 30-minute introductory call with our engineering lead, followed by a technical coding assessment (1–2 hours, take-home or live-pair), and a final conversation with the team. We aim to make hiring decisions within 2 weeks of final interviews.
