

Eve Fraudster

Software Engineer & Builder

✉ eve.fraudster@example.com

in/EveFraudster

github

Final-year BSc Computer Science student with hands-on full-stack experience across React, TypeScript, Node.js, and PostgreSQL, plus a growing track record of shipping small, well-tested features into real codebases. Comfortable working in Docker-based developer environments and on AWS-hosted services, and motivated by infrastructure-tooling problems where polished UX meets reliable backends. Looking for a summer internship where I can pair with senior engineers, contribute to production systems, and deepen my full-stack craft.

Experience

Software Engineering Intern (Part-time) — Jun 2025 – Present

LyncFit — Remote (UK)

- Built core front-end features of the React-based web app for run-clubs to manage events and members efficiently.
- Designed reusable UI components for chat, forum, and broadcast pages, improving consistency and reducing duplicate code.
- Developed approximately 25% of the mobile app's front-end using Flutter (Dart), including Rewards and Profile sections.
- Integrated the frontend with Spring Boot REST APIs, managing state, background data refresh, and light caching to keep the UI in sync with the backend.

Software Engineering Intern — Jul 2024 – Sep 2024

Northwind Cloud Labs — Remote (UK)

- Built a TypeScript + React dashboard for monitoring deployment pipelines, consuming a Node.js Express REST API and rendering near-real-time status from a PostgreSQL backend.
- Implemented a suite of Jest and React Testing Library tests across both the frontend and backend, lifting branch coverage from roughly 40% to over 80% on the modules I owned.
- Containerised the dashboard using Docker and wired it into the team's GitHub Actions CI/CD pipeline, halving local-environment setup time for new joiners.
- Paired with senior engineers on AWS-deployed services (EC2, S3) for log ingestion and gained working familiarity with CloudFormation templates for environment provisioning.

Christmas Customer Assistant — Dec 2024 – Dec 2024

Marks & Spencer Food — Birmingham, UK

- Replenished 200+ products per shift overnight, ensuring stock availability for morning opening to support seasonal sales targets.
- Worked closely with a team of 15+ to check expiry dates and product freshness, demonstrating reliability and efficiency under pressure.

Projects

DevPulse — Open-source CI/CD Mini Dashboard — Mar 2025 – Jun 2025

TypeScript, React, Node.js (Express), PostgreSQL, Docker, AWS

- Designed and built a small open-source dashboard that surfaces build, test and deploy status from a Node.js Express API into a React + TypeScript frontend.
- Modelled pipeline runs in PostgreSQL with a lightweight schema, exposed read endpoints documented with OpenAPI, and wrote Jest unit tests covering the core service layer.
- Packaged the stack with Docker Compose for local use and deployed a demo environment to AWS (EC2 + RDS), automating image builds via GitHub Actions.

TerraTrack — Infrastructure-as-Code Cost Tracker — Oct 2024 – Jan 2025

TypeScript, Node.js, Express, PostgreSQL, Docker

- Built a side-project that parses Terraform plan outputs and stores estimated AWS resource costs in PostgreSQL, exposing trends through a small React + TypeScript UI.
- Implemented authenticated REST endpoints in Node.js (Express), wrote Jest integration tests against a Dockerised database, and shared the project on GitHub for feedback.

AI Gym Coach — Aug 2025 – Present

Spring Boot, PostgreSQL, React (TypeScript), Node.js, OpenAI API

- Designed a full-stack fitness app letting users log workouts, track goals, and access AI-powered Q&A on training and form.
- Built a Spring Boot + PostgreSQL backend integrated with a React (TypeScript) frontend, plus a Node.js microservice exposing the OpenAI-powered features.

Agile Team Project — Student Networking App — Jan 2025 – May 2025

Angular (TypeScript), Spring Boot, PostgreSQL, JHipster

- Owned the user-matching feature in a full-stack student networking app, implementing accept/decline flows and request handling within an eight-person team.
- Built the front-end in Angular (TypeScript) with HTML/CSS, integrated with a Spring Boot + PostgreSQL backend in a JHipster-generated project under Agile and Git workflows.

Encode Club AI Hackathon — NoteBank / SemSync / CramBot — Apr 2024 – Apr 2024

React, Tonk stack, Ollama AI API

- In a 48-hour hackathon, built a React-based 'internet of mini-apps' for collaborative studying — note-sharing, deadline tracking, and AI-generated flashcards.
- Led the NoteBank UI as part of a four-person team and integrated all three apps over a shared backend; awarded first place in the bounty category.

Education

BSc Computer Science — June 2026 – Nov 2017

Birmingham, UK

and Provider package — Oct 2016 – Jan 2019

Edinburgh, UK

Marks & Spencer Food Birmingham — Dec 2014 – Nov 2017

UK

Skills

TypeScript
