SKILLS

Languages

Python, JavaScript, SQL

Tech

Node.js, PostgreSQL,
REST APIs, Docker

Tools

Git, Postman, Docker
Compose, Linux

ACTIVITIES

McGill Developers Club

Backend Track
Mentor

September 2023 -
Present

HackMcGill 2024

Participant & Top 10
Finalist
February 2024

EDUCATION

McGill University — *Bachelor of Science in Computer Science* 2022 - 2026

- Relevant Coursework: Database Systems, Software Engineering, Algorithms & Data Structures
- GPA: 3.7/4.0

EXPERIENCE

Shopify — *Backend Engineering Intern* June 2024 - August 2024

- Developed 2 REST API endpoints using Node.js and Express that processed 50K+ daily requests for order fulfillment queries, reducing average response time by 18%.
- Optimized PostgreSQL database queries for customer transaction history retrieval, achieving 32% faster query execution across 2M+ records.
- Collaborated with 4 senior engineers to implement Docker containerization for 3 microservices, reducing deployment time from 25 minutes to 8 minutes.

PROJECTS

Distributed Task Queue System — *Python, Redis, PostgreSQL, Docker* January 2024 - March 2024

- Built a task queue system that processed 1000+ asynchronous jobs per minute with failure retry logic, reducing failed job rate from 8% to 1.2%.
- Implemented worker pool architecture supporting 6 concurrent workers using Python threading, increasing throughput by 40% compared to single-worker prototype.

REST API Hackathon Project - PriceTracker — *Node.js, Express, MongoDB, Heroku* October 2023

- Designed backend API for price monitoring SaaS that tracked 500+ product listings across 3 e-commerce platforms with 95% uptime.
- Implemented JWT-based authentication and rate limiting, handling 2000+ authenticated requests daily during hackathon demo.

School Course Registration System — *JavaScript, Node.js, SQLite* November 2023 - December 2023

- Engineered backend API for course enrollment that managed concurrent registrations for 800+ students across 40 courses using transaction-based locking.
- Reduced double-booking incidents by 100% through row-level database locks, handling peak registration with zero data inconsistencies.
